TYPES OF OPERATING SYSTEM

BATCH OS

Jobs are collected in batches and executed sequentially without user interaction.

Has slower response than

Provides better interaction than

Advantages

* High Throughput
* Good for large jobs

Limitations

* No user interaction
* Long response time

TIME SHARING OS

Allows multiple users to interact with the system simultaneously

Time sharing OS runs on a single system, while Distributed OS works on multiple systems

Advantages

* Fast response time
* Better user interaction
* CPU sharing

Limitations

* Higher overhead
* Security issues

DISTRIBUTED OS

Multiple computers work together as a single system

Distributed OS focuses on resource sharing, while Real-Time OS focuses on timely response.

Advantages

* Resource sharing
* High reliability
* Scalability

Limitations

* Complex communication
* Difficult to manage

REAL - TIME OS

Responds to input and processes data within strict time limits

HARD REAL-TIME

Strict deadlines must be met

SOFT REAL-TIME

Some delay is acceptable

Advantages

* Predict response
* Used in critical systems

Limitations.

* Expensive
* Difficult to design

SIMILARITIES

- All manages system resources
- All manage processes
- All provide services to users
- All ensure system efficiency
